

A useful and engaging website is the gateway for any business to attract new customers and qualified employees. MAR brings together the right mix of staff and resources, including graphic designers and web engineers, to design and implement practical and aesthetic business-oriented websites for our customers. We make sure to custom tailor your website to succinctly and effectively communicate your company or agency's specific business capabilities, strengths, and needs to potential clients and job candidates.

Oil and Hazardous Materials Simulated Environmental Test Tank (Ohmsett), Website Redesign

In 2004, MAR was brought in to upgrade and modernize Ohmsett's website, a process which entailed developing document and content management features to ease website maintenance, as well as replacing existing static html web pages with dynamic server-based pages. In addition, our IT staff consolidated all website services to a single host. The redesigned web site went live in the same year.

In 2007 MAR completed a major enhancement to the website that added a comprehensive document management capability for Ohmsett's Summary of Activities. The result is a fully hosted website that allows all information, including basic content, videos, and publication documents to be accessed at a single location. The new content management enhancements will also facilitate the implementation of future web capabilities without the assistance of a third party.
